**Department of neuropsychology and psychopharmacology**

**Psychedelic research team, University Maastricht, Maastricht, The Netherlands**

At Maastricht University we have a long standing history conducting psychopharmacological trials in human volunteers. Our team mainly focuses on the acute and persisting effects of psychedelic substances on social behavior and cognition and its underlying neurobiology. To that end, we conduct placebo-controlled, clinical trials in (healthy) volunteers using a range of subjective (questionnaires), behavioral (empathy, creativity, memory (computer-based and virtual reality) tests), physiological (cardiac measures, blood determinations for hormone concentrations and neuroplasticity parameters), and neuroimaging (EEG, fMRI (3T, 7T)) measures. When you join us for an internship we will offer you a peek in our 'kitchen' and you can acquire hands-on training on one or more of the running projects.
